

Video Storyboard

Set Up Your Password Manager: Bitwarden onboarding

Designer: Amanda Miller

Asset type: Software tutorial. Screencast with generated B-roll.

Runtime: 7:12, 24 scenes, three task blocks

Audience: Employees onboarding to a company password manager. No prior security knowledge assumed.

Performance problem: Password reuse across personal and work accounts. One breach exposes email, banking and payroll.

Delivery: Hosted video, viewable on demand. No LMS dependency.

Produced with: OBS Studio (capture), Kdenlive (edit), Audacity (audio), Google Veo (B-roll), Pixabay (assets)

Terminal objectives

- 1. Install Bitwarden and log into the vault.
- 2. Migrate existing browser-saved passwords into the vault and remove every unprotected copy.
- 3. Generate and save a strong, unique password when creating a new account.

Structural notes

Objectives are stated at 0:32 and repeated at 6:34 in the same order.

The cold open, Dana and her 11 reused passwords, returns at 6:57 with the numbers inverted.

Cleanup is part of the task. The export file is flagged as unprotected when it is created at 2:56, destroyed in two stages at 4:14, and the browser’s save prompt is switched off at 4:53 so the problem does not return.

The video ends on a single action for the learner to take that day.

Scene breakdown

#	Timecode	Visual / On-screen action	Narration (VO)	On-screen text & graphics	Design notes
OPEN: ESTABLISH THE STAKES (0:00-0:49)					
1	0:00-0:15	Inbox view. A breach notification email arrives. Motion graphic: one key icon fans out to eleven account tiles. Email, bank and payroll highlighted.	“Dana got an email this morning. One of her passwords showed up in a data breach. Not a big deal, except Dana uses that password for 11 different accounts. Her email, her bank, payroll.”	11 accounts. 1 password.	Cold open. Stakes before agenda. Generated B-roll.
2	0:15-0:32	Transition out of the scenario into the title card. Music cue enters under VO.	“This video will make sure that’s never you. In the next five minutes, you’ll set up a password manager that remembers strong, unique passwords for every account, so you only ever have to remember one.”	Title: Set Up Your Password Manager	Payoff and time cost stated up front.

#	Timecode	Visual / On-screen action	Narration (VO)	On-screen text & graphics	Design notes
3	0:32-0:49	Three item list animates in, one line per objective. Cut to browser desktop on “Let’s get started.”	“By the end of this video, you’ll be able to do three things. Install Bitwarden and log into your vault. Move your existing passwords into it, and create strong new passwords automatically. Let’s get started.”	1. Install and log in 2. Migrate existing passwords 3. Generate strong passwords	<i>Objectives stated here. Scene 22 repeats them in the same order.</i>
TASK 1: INSTALL BITWARDEN AND OPEN THE VAULT (0:49-2:30)					
4	0:49-0:59	Screen recording. Firefox add-ons store opens.	“First, the install. Open your browser’s extension store. We’re using Firefox here, but the steps are nearly identical in Chrome and Edge.”	Firefox shown. Chrome and Edge nearly identical.	<i>Cross-browser note placed before the first click.</i>
5	0:59-1:14	Type “Bitwarden” into the store search field. Click the result title. Click Add to Firefox.	“Then type Bitwarden in the search. Click on the title. Then click Add to Firefox.”	Cursor highlight on each click target.	<i>Zoom and highlight on every click target. No filler narration between actions.</i>
6	1:14-1:30	First permission popup. Click Add. Second popup. Checkmark “Pin extension to toolbar,” then click OK.	“On the first popup, go ahead and click Add. On the second popup, make sure the Pin extension to toolbar box is checkmarked so it’s always just one click away. Then click OK.”	Callout circle on the pin checkbox.	<i>Pinning heads off the most common “where did it go” question.</i>
7	1:30-1:57	Click the shield icon in the toolbar. Bitwarden login panel opens.	“Then click on the shield icon to open Bitwarden. If your company set up an account, log in with the provided account information. Otherwise, creating a free account takes about a minute.”	Company account? Use provided credentials.	<i>Managed and self-serve accounts handled in narration. Avoids a branch and keeps one runtime.</i>
8	1:57-2:18	Master password field in focus. Comparison graphic. Short complex string beside a four word passphrase.	“One important idea before we go on. Your master password is the last password you’ll ever need to memorize. So make it long. A phrase of four or five random words is stronger than something short and complicated, and much easier to remember.”	4 to 5 random words beats short and complicated.	<i>Concept taught at the point of use.</i>
9	2:18-2:30	Vault opens. Empty state.	“And you’re in. This is your vault. Every password you save will live here, encrypted and available on any device you log into.”		<i>Objective 1 complete.</i>
TASK 2: MIGRATE SAVED PASSWORDS, THEN CLEAN UP (2:30-5:16)					
10	2:30-2:50	Firefox menu, then Passwords. Saved passwords list displayed.	“Now, the step that makes this painless. Moving passwords your browser already saved into your vault. You won’t retype anything. In Firefox, click on the menu and go down to Passwords. This has all the passwords that we saved in Firefox.”	You won’t retype anything.	<i>“You won’t retype anything” answers the main objection early.</i>

#	Timecode	Visual / On-screen action	Narration (VO)	On-screen text & graphics	Design notes
11	2:50-3:15	Dots menu, then Export passwords. Firefox warning dialog about the unprotected file. Click Continue with export.	“Then on the dots menu on the right side, choose Export passwords. As this warning states, the saved file is completely unprotected, so treat it like cash, and make sure to follow all the steps at the end to completely delete this file from your computer. When we’re done, click Continue with export.”	Highlight on the warning text. Unprotected file. Delete it at the end.	<i>Risk named where it is created.</i> <i>Forward reference to the cleanup steps.</i>
12	3:15-3:21	Save dialog. Choose location, click Export. CSV file appears in the chosen folder.	“Choose where to save it, then click Export.”		<i>Keep the save location on screen.</i> <i>The learner needs to find this file again in Scene 15.</i>
13	3:21-3:46	Click the Bitwarden icon. Path A: “Import passwords” prompt. Path B: Settings, Vault options, Import. File format dropdown. Select the source browser.	“Next, click the Bitwarden icon in your add-ons. If you have the popup that says Import passwords, you can click that. Otherwise, click Settings, Vault options, and Import. Leave the first two values the same, but when we come to the file format, make sure to pick the correct browser from the list, like Chrome, Firefox or Safari.”	File format: match your browser.	<i>Two possible UI states covered in one take.</i> <i>Wrong file format is the most common import failure.</i>
14	3:46-4:14	Choose file, Import, OK. Back arrow, then Vault. Vault list now populated.	“Then click to choose the file and Import. Then click OK. Click the back button next to Vault options, then click the Vault at the bottom. You should see all your passwords were successfully imported.”	Passwords imported.	<i>Verification before deletion.</i>
15	4:14-4:35	File manager. Right click the export file, Move to trash. Open trash, right click, Delete from trash.	“Two cleanup steps, and they matter. Go into your files and delete that export file. Right click, move to trash. Then you also want to go into your trash and delete the file from there as well. Right click, delete from trash.”	Two cleanup steps, both required.	<i>Emptying the trash is the step most tutorials skip.</i> <i>Show both stages.</i>
16	4:35-4:53	Return to the Firefox passwords page. Dots menu, then Remove all passwords. Confirm checkbox, then Remove all.	“Next, remove the saved passwords from your browser. In our passwords page, we’re going to click the dots menu and click Remove all passwords. Checkmark the yes box, then click Remove all.”		<i>Safe because Scene 14 confirmed the import first.</i>
17	4:53-5:16	Firefox menu, Settings, Passwords and security. Uncheck “Ask to save passwords.”	“Last, we’re going to turn off our browser’s offer to save new passwords. Go to your browser’s menu, click Settings, on the left click Passwords and security, and uncheck Ask to save passwords. Then you’re done.”	Ask to save passwords: off.	<i>Objective 2 complete.</i> <i>Switching off the prompt keeps the browser from rebuilding the problem.</i>
TASK 3: CREATE NEW LOGINS THE RIGHT WAY (5:16-6:34)					
18	5:16-5:39	Sample work tool. Click Sign up.	“Last task. Creating new logins the right way, starting	New login	<i>Shift from cleanup to</i>

#	Timecode	Visual / On-screen action	Narration (VO)	On-screen text & graphics	Design notes
		Click the username field. Bitwarden popup offers “New login.” Website field already populated.	today. Say you’re signing up for a new work tool. All you have to do is go into the website and click Sign up. When you click in the username box, click the popup from Bitwarden that says New login. Once you do, you have the website already filled out for you. You just need to fill in your username and password. For this one, our username is our email.”		<i>habit.</i>
19	5:39-6:08	Click Generate password. Generator panel. Length slider and character type toggles.	“Now, instead of inventing a password, click the Generate password button. You can adjust the settings, but the defaults are strong. Sixteen characters or more is a good rule, and if your website allows, adding special characters is a good idea too.”	16 characters or more.	<i>Guidance given as a number the learner can act on.</i>
20	6:08-6:26	Click Use password, then Save. Return to the site. Bitwarden autofills the email and password fields.	“Bitwarden creates one that’s long, random, and unique. A password that you will never need to see, type, or remember. Click Use password and Save. Now Bitwarden fills it in for you when you click in the email and password.”	Never see it. Never type it. Never remember it.	<i>The generated password is framed as a relief rather than a burden.</i>
21	6:26-6:34	Vault view. The new entry sits alongside the imported ones.	“As you can see, this entry is now saved in your vault along with your other passwords, ready to use when you come back to the site.”		<i>Objective 3 complete.</i>
CLOSE: RECAP, CALLBACK, NEXT ACTION (6:34-7:12)					
22	6:34-6:57	Three item checklist returns. Each line ticks off as it is named.	“That’s it. Three tasks done. You installed Bitwarden and set up a strong master password. You moved your old passwords into the vault and cleaned up after. And you know how to generate strong, unique passwords from now on.”	Installed and logged in Migrated and cleaned up Generating strong passwords	<i>Direct map onto Scene 3. Same order, same wording.</i>
23	6:57-7:05	Callback graphic. Dana’s eleven account tiles, each now with its own distinct key.	“Remember Dana? Eleven accounts, one reused password. Now you have eleven unique passwords, and only one to remember.”	11 unique. 1 to remember.	<i>Bookend. Same numbers as the cold open, inverted.</i>
24	7:05-7:12	Closing card. Music resolves.	“Your next step: the next time you log into anything, let Bitwarden save it. Within a week, your vault will cover almost everything you use.”	Next step: let Bitwarden save your next login.	<i>One transfer action. Something to do today.</i>
